

AMENDMENTS TO THE CLAIMS

1. (Currently Amended) A method for forming a device isolation layer of a semiconductor device, comprising the steps of:

forming a pad layer pattern defining a device isolation layer on a substrate, wherein the pad layer pattern includes a pad oxide layer and a pad nitride layer;

forming a trench by etching an exposed portion of the substrate with use of the pad layer pattern as a mask;

performing an etching process to make top corners of the trench rounded by controlling an angle of the top corners of the trench ~~according to a contained quantity of hydrogen bromide and chlorine gas in an etching gas, wherein, under a predetermined common condition, angles of about 30°, about 45°, and about 90° of the top corners are made in response to a different etching time;~~

forming a lateral oxide layer on a partial surface of the substrate, the partial surface consisting of sidewalls and a bottom area in the trench by a dry oxidation technique, wherein the dry oxidation technique oxidates the sidewalls and bottom area in the trench formed by the etching process;

forming a liner nitride layer on the lateral oxide layer;

forming an insulation layer on the liner nitride layer to fill the trench;

planarizing the insulation layer until the pad nitride layer is removed; and

removing the pad oxide layer.

2. (Currently Amended) The method as recited in claim 1, wherein an angle of the top corners of the trench is controlled ~~in a range from about 30° to about 60° according to a contained quantity of hydrogen bromide and chlorine gas in an etching gas.~~

3. (Previously Presented) The method as recited in claim 2, wherein the step of performing the etching process includes the steps of:

performing an etching process by using hydrogen bromide;

removing a native oxide layer formed after the etching process by using carbon tetrafluoride (CF₄) gas;

performing an etching process with use of a gas containing hydrogen bromide and chloride gas to form the trench with a predetermined depth; and

performing an etching process by using a gas containing CF₄ and oxygen (O₂) gas to purge the chloride gas from a chamber.

4. (Original) The method as recited in claim 1, wherein the etching process proceeds by employing an isotropic etching technique.

5. (Currently Amended) The method as recited in claim 4, wherein an angle of top corners of the trench ~~is controlled-ranges from about 50° to about 80°~~ through the use of the isotropic etching technique.

6. (Original) The method as recited in claim 4, wherein the isotropic etching technique uses a gas containing CF₄ and O₂ gas.

7. (Cancelled)

8. (Previously Presented) The method as recited in claim 1, wherein the dry oxidation technique is performed at a temperature of about 900°C to about 1000°C to form the lateral oxide layer with a thickness ranging from about 60 Å to about 100 Å.

9. (Currently Amended) A method for fabricating a semiconductor device, comprising the steps of:

forming a pad oxide layer and a pad nitride layer defining a device isolation layer on a substrate

forming a trench of which top corners are rounded by etching a surface of a substrate to a predetermined depth by controlling an angle of the top corners of the trench ~~according to a contained quantity of hydrogen bromide and chlorine gas in an etching gas, wherein, under a~~

predetermined common condition, angles of about 30°, about 45°, and about 90° of the top corners are made in response to a different etching time;

performing an etching process to the trench so that the top corners of the trench become more rounded;

forming a lateral oxide layer on a partial surface of the substrate, the partial surface consisting of sidewalls and a bottom area of the trench by oxidating sidewalls of the trench and the bottom area in the trench formed by the etching process;

forming a liner nitride layer on the lateral oxide layer;

forming an insulation layer on the liner nitride layer to bury the trench;

planarizing the insulation layer until the pad nitride layer is removed;

removing the pad oxide layer until a surface of the substrate is exposed;

forming an oxide layer on the exposed surface of the substrate; and

forming a conductive layer for a gate electrode on an entire surface of a structure containing the oxide layer.

10. (Original) The method as recited in claim 9, wherein the step of forming the oxide layer includes the steps of:

forming a screen oxide layer for a threshold voltage control on the substrate;

implanting a dopant for a threshold voltage control by using the screen oxide layer as a mask;

removing the screen oxide layer; and

forming a gate oxide layer on an exposed surface of the substrate after removing the screen oxide layer.

11. (Original) The method as recited in claim 9, wherein the lateral oxide layer is formed through a dry oxidation technique.

12. (Original) The method as recited in claim 10, wherein the screen oxide layer and the gate oxide layer are formed through a dry oxidation technique.

13. (Original) The method as recited in claim 11, wherein the lateral oxide layer is formed at a temperature ranging from about 900°C to about 1000°C with a thickness in a range from about 60 Å to about 100 Å.

14. (Original) The method as recited in claim 12, wherein the screen oxide layer is formed at a temperature ranging from about 850°C to about 1000°C with a thickness in a range from about 50 Å to about 150 Å.

15. (Original) The method as recited in claim 12, wherein the gate oxide layer is formed at a temperature ranging from about 850°C to about 1000°C.

16. (Currently Amended) The method as recited in claim 9, wherein at the step of forming the trench of which top corners are rounded, the top corners of the trench are rounded ~~in an angle of about 30° to about 60°~~ according to a contained quantity of hydrogen bromide and chlorine gas in an etching gas.

17. (Original) The method as recited in claim 16, wherein the step of forming the trench further includes the steps of:

- performing an etching process by using hydrogen bromide;
- removing a native oxide layer formed after the etching process by using CF₄ gas;
- performing an etching process by using a gas containing hydrogen bromide and chlorine gas until the trench has a predetermined depth; and
- performing an etching process with use of a gas containing CF₄ and O₂ gas to purge chlorine gas from a chamber.

18. (Original) The method as recited in claim 9, wherein the step of making the top corners of the trench more rounded proceeds by employing an isotropic etching technique.

19. (Currently Amended) The method as recited in claim 18, wherein the top corners of the trench is controlled to have an angle ranging from about 50° to about 80° through the use of the isotropic etching technique.

20. (Original) The method as recited in claim 18, wherein the isotropic etching technique proceeds by using a gas containing CF₄ and O₂ gas.

21. (New) The method as recited in claim 1, wherein, if the predetermined common condition for over-etching the pad layer includes a pressure of about 88 mtorr, a power of about 600 W, a CF₄ with about 50 sccm, and an Ar with about 300 sccm, the angles of about 30°, about 45°, and about 90° of the top corners are made at different etching times of about 0", about 10", and about 0".

22. (New) The method as recited in claim 21, wherein, if the predetermined common condition includes a pressure of about 10 mtorr, a source power of about 1000 W, a bias power of about 275 W, a HBr with about 40 sccm, a He with about 10 torr, and a temperature of about 20 °C, the angles of about 30°, about 45°, and about 90° of the top corners are made at different etching times of about 5", about 0", and about 0".

23. (New) The method as recited in claim 22, wherein, if the predetermined common condition includes a pressure of about 10 mtorr, a power of about 600 W, a bias power of about 90 w, a CF₄ with about 80 sccm, a He with about 10 torr, and a temperature of about 20 °C, the angles of about 30°, about 45°, and about 90° of the top corners are made at different etching times of about 0", about 7", and about 7".

24. (New) The method as recited in claim 9, wherein, if the predetermined common condition for over-etching the pad layer includes a pressure of about 88 mtorr, a power of about 600 W, a CF₄ with about 50 sccm, and an Ar with about 300 sccm, the angles of about 30°, about 45°, and about 90° of the top corners are made at different etching times of about 0", about 10", and about 0".

25. (New) The method as recited in claim 24, wherein, if the predetermined common condition includes a pressure of about 10 mtorr, a source power of about 1000 W, a bias power of about 275 W, a HBr with about 40 sccm, a He with about 10 torr, and a temperature of about 20 °C, the angles of about 30°, about 45°, and about 90° of the top corners are made at different etching times of about 5", about 0", and about 0".

26. (New) The method as recited in claim 25, wherein, if the predetermined common condition includes a pressure of about 10 mtorr, a power of about 600 W, a bias power of about 90 w, a CF₄ with about 80 sccm, a He with about 10 torr, and a temperature of about 20 °C, the angles of about 30°, about 45°, and about 90° of the top corners are made at different etching times of about 0", about 7", and about 7".
